4 **8.3.1.1 BC Hydro's Straight-Line, Average Service Life Method of**  
 5 **Calculating Depreciation is Appropriate and Widely Accepted**

6 BC Hydro uses the straight-line, average service life method for calculating  
 7 depreciation expense, which complies with IFRS. The key feature of this method is  
 8 that depreciation expense is recognized evenly over the expected useful life of an  
 9 asset.

10 As part of the Depreciation Study, BC Hydro asked Concentric to assess whether the  
 11 use of the straight-line, average service life method was appropriate. Concentric  
 12 provided the following opinion at page 3-1 of the Depreciation Study:

1 Depreciation, as used in accounting, is a method of distributing  
2 fixed capital costs, less net salvage, over a time period by  
3 allocating annual amounts to expense. Each annual amount of  
4 such depreciation expense is part of that year's total cost of  
5 providing electric utility service. Normally, the time over which  
6 the fixed capital cost is allocated to the cost of service, is equal  
7 to the time over which an item renders service – that is, the  
8 item's service life. The most prevalent method of allocation is to  
9 distribute an equal amount of cost to each year of service life.  
10 This method is known as the Straight-Line method of  
11 depreciation.

12 BC Hydro continues to determine depreciation using the  
13 Straight-Line method for all plant comprising regulated assets,  
14 based on the Average Life Group Procedure – Remaining Life  
15 Technique. The Average Life Group Procedure is the most  
16 commonly used depreciation procedure for North American  
17 utilities, whereby one average service life estimate is applied to  
18 all assets and vintages within the asset class. The Remaining  
19 Life Technique calculates depreciation on the basis of  
20 recovering the net book value of the investment over the  
21 remaining life of an asset, or group of assets, with no provision  
22 for separate accumulated depreciation true-up. As such, a  
23 common life and salvage estimate is applied to each of the  
24 assets. Concentric finds the application of the Straight-Line  
25 method and the Average Life Group Procedure – Remaining  
26 Life Technique results in a reasonable recovery of BC Hydro's  
27 capital investment over time and recommends their continued  
28 application.

29 Consistent with the above recommendations, BC Hydro will continue to use its  
30 straight-line, average service life methodology for calculating depreciation expense.

### 31 **8.3.1.2 BC Hydro is Updating the Useful Lives of its Assets as** 32 **Recommended by Concentric**

33 The key component of the Depreciation Study is the review and assessment of the  
34 useful lives of BC Hydro's asset classes. BC Hydro uses the average service lives in  
35 conjunction with the asset ages to determine the remaining service life for  
36 calculating depreciation in accordance with the Remaining Life Technique, as  
37 recommended by Concentric.
